

Brainstorming & Idea Prioritization

Project Title: Rising Waters

Introduction

Natural disasters, especially floods, cause severe damage to human life, agriculture, property, and infrastructure every year. During the brainstorming phase, several project ideas were discussed by considering their social impact, innovation, feasibility, and practical implementation. Different domains such as healthcare, agriculture, education, and real estate were analyzed before selecting the final project.

Brainstorming Process

The team explored various project ideas including Crop Recommendation System, Heart Disease Prediction, House Price Prediction, Student Performance Prediction, and Flood Prediction System. Each idea was carefully evaluated based on the availability of datasets, ease of development, technical feasibility, real-world usefulness, and future scope. Among all the proposed ideas, the Flood Prediction System was identified as the most beneficial project because of its direct contribution to disaster management and public safety.

Idea Prioritization

The Flood Prediction System was selected as the final project because it addresses a significant real-world problem. The system uses Machine Learning techniques to analyze weather-related parameters such as temperature, humidity, cloud cover, and rainfall data to predict the possibility of floods. The project has the potential to provide early warnings, helping people and government authorities take preventive actions before flood situations become critical.

Conclusion

After completing the brainstorming and evaluation process, the Flood Prediction System using Machine Learning was finalized as the project. It provides a practical, innovative, and socially beneficial solution by combining Machine Learning with a Flask-based web application to predict flood risks accurately and efficiently.
