

Project Executable Files

Project Title: Rising Waters

Introduction

The executable files are the essential project files required to run the Rising Waters application successfully. These files include the trained Machine Learning model, Flask application, dataset, templates, and static resources.

Project Files

The project contains the main application file (app.py), the trained Machine Learning model (floods.save), the scaler file (transform.save), the dataset in CSV format, HTML template files, CSS and JavaScript files, and other supporting resources required for execution.

Execution Process

To run the application, all required project files must be available in their respective folders. The Flask application loads the trained model and scaler, starts the web server, accepts user input through the browser, processes the data, and displays the prediction result.

Software Requirements

The project requires Python, Flask, Pandas, NumPy, Scikit-learn, XGBoost, Joblib, and a modern web browser for execution.

Output

After execution, the application displays either **Flood Risk** or **No Flood Risk** along with the prediction probability based on the user-provided weather parameters.

Conclusion

The executable files enable the complete functioning of the Rising Waters system. Proper organization of these files ensures smooth execution, easy deployment, and reliable flood prediction.
