

Customer Journey Map

Project Title: Rising Waters

Introduction

The Customer Journey Map describes the complete experience of a user while interacting with the **Rising Waters** application. It explains how users access the system, provide weather information, receive flood predictions, and take necessary actions based on the results.

Awareness

Users become aware of the application through educational institutions, online platforms, or recommendations. They understand that the system can predict flood risk using weather-related data.

Accessing the Application

The user opens the web application and navigates to the prediction page. The interface is designed to be simple, allowing users to use the system without technical knowledge.

Providing Input

The user enters weather parameters such as temperature, humidity, cloud cover, and rainfall values into the application. The system validates the entered information before processing it.

Prediction Process

The Machine Learning model analyzes the input data and predicts whether there is a possibility of flooding. The prediction is completed within a few seconds.

Viewing Results

The application displays the prediction result along with the probability of flood occurrence. Based on the result, the user can understand the current flood risk.

Taking Action

If flood risk is predicted, users can take precautionary measures and follow safety guidelines. If no flood risk is detected, users can continue monitoring weather conditions.

Conclusion

The **Rising Waters** application provides a smooth and user-friendly experience by delivering quick and accurate flood predictions, helping users make informed decisions during adverse weather conditions.
